

Robust Loss Functions Against Three Outlier Distributions (Eq. 8.7)

LOS: median error 0.021 m -> 0.021 m

Sporadic: median error 0.252 m -> 0.098 m

NLOS: median error 0.684 m -> 0.683 m

Bar = RMSE, black tick = median

Why 1.345 destroys this filter: the tail is not Gaussian

Eq. (8.7) scale factors: the textbook delta inflates a clean run

Sporadic outliers: the win is steady state, not the turns (shaded) Ungated NIS: even LOS sits above a consistent filter

Half the NLOS anchors are biased all run: no inlier majority
